

What is the best economic system for post-scarcity?

111 376 62 22 711

Background

Post-scarcity involves two conditions [for this discussion]: 1) people don't want to make money much anymore, because they have wealth (doesn't mean they don't have the option to get a job or start a business for profit or be given it, just less inclined), 2) people do not need to make money, because there is an endless abundance where every person's need is fulfilled for very cheaply.

With rapid advances in technology and the fast pace of technology, people are not always able to keep up with them and risk getting dropped off or lost. The world's (and smaller, like country, state...) economy doesn't always support them during these transition/disruption times.

Because of this, it is good to examine economic system alternatives that'll support more people with a better quality-of-life when post-scarcity comes, especially during critical times as the one mentioned before. Should civilization keep the economics it has, because the change is too arduous, or go with a new one, because the old one is to obsolete in post-scarcity? This is what this discussion delves into.
