

Is transhumanism the next step in human evolution?

335 / 1.5k / 314 / 116 / 6.5k

For all of history, evolution has been mostly natural and biologically-based. Now, humans have the potential to create artificial and non-biological evolution. Transhumanism (word originating in 1927) by definition artificial human enhancement, takes up 3 forms: cyborgs, genetic editing, and digitizing reality.

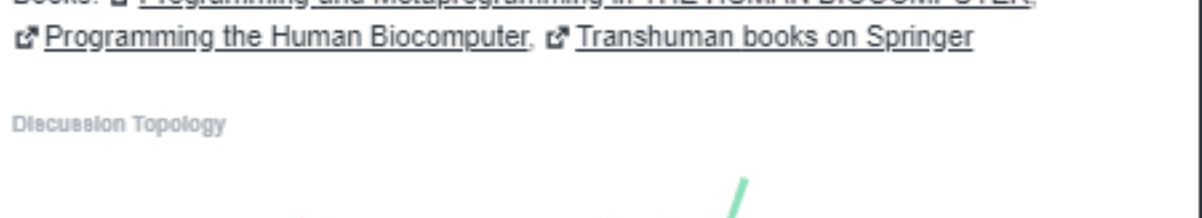

With the **technological singularity** in 2025 and a **transhuman residential lab**, one solution is to merge with robots. This can help humans stay relevant post-singularity. Many applications (such as chess) show that humans combined with computers are more capable than the automators alone.

Is the transhumanism ascension not just a good solution, but a necessary action that humans need to take to prevail in the technology age? This discussion helps us find out if this is the case or not. It provides the positive and negative outcomes, along with the means that humans could take to achieve them and vice versa.

Evolution of life has branched many times, but each branch has steps. Humans are the last remaining species in our branch and if transhumans come into existence, may supersede humans as a species (although humans and transhumans could live alongside each other for a while).

PS - the admin here doesn't know enough about transhumanism and is trying to learn more about it, so expect them to not know about advancements or logistics about how it works. Instead, it's good for us all to work together in helping each other out to learn more, so that we all benefit.
