

Vertical Farming is the Future of Agriculture

213 820 127 47 2.2k

Background
Vertical farming is more viable for food production as the population moves to cities in the future. It also resolves the [21st century world issue of feeding a growing population](#).

Current agriculture is one of the most resource-intensive activities on Earth that degrades the environment. Because of this problem, various solutions appear to help in concept, but are not well-developed enough to bring into reality. This discussion refers to one such concept, vertical farming, and tries to develop it to one day become a viable option. Participation in this discussion helps ideas feasibly become the future!
