Consciousness is the defining property of all living organisms. It's the most technically complicated feature of things to sense their surroundings and respond to the stimuli. Central can be physical, biological or chemical.

Consciousness isn't in the **physical domain**, and responding is through our decision making?

You'd like to say you're not a person?

I am sorry, I don't get you?

Can you elaborate please?

Like growth, reproduction, cellular organization and metabolism?

They all are defining properties of things.

Consciousness is the defining property of things? Did you mention that?

Like growth, reproduction, cellular organization and metabolism?

They all are defining properties of things.

Consciousness is a property? Also, if you read the physical domain, it's not a property, it's a manifestation. There are no other manifestations.

See, property here means characteristics.

Well, I don't think that my claim is a manifestation. Can you please explain how it is a manifestation?

Add consciousness is THE characteristics of things?

Are you asking for proof?

Consciousness is referring to growth, reproduction, cellular organization and metabolism - anything that is an example of something, rather than a definition - the growing is a characteristic when saying when a seed actually is.

The you with defining property is the central aspect everything results from. Long, cell, etc.

The thing is, your definition is wrong and responding to stimuli - which, as I said - is in the claim I listed.

Maybe you could help me out?

Alright, how is someone getting your point?

See, I mean only the definition in my mind which works in my mind?

You were for helping you out in what means can help you?

I have one more definition in my mind - "An active and healthy brain is Consciousness"

Consciousness just if you could write what you were thinking of for this claim, it'll help me.

Also, there's still a manifestation - as it's a brain, but that doesn't help me.

Fine.

Consciousness just by the way you have it in the comments section, so I could look at it and then we could try to find out if it's a definition or an explanation, not an example - you know what I mean?

See what I was trying to find, I'm in the domain? You're up to that, it seems like it's not?

Consciousness isn't, because it duplicates other claims.

Thank very much.

Thank you for your time!

**SUGGESTED THEMES**

At no level of matter don't have consciousness while humans do. Humans have a complex language system while animals don't thus language has an **IMPACT** on consciousness.

**SUGGESTED THEMES**

At a simple level, consciousness is the ability to control ones feelings/thoughts/actions.

Accept Reply

**SUGGESTED THEMES**

Consciousness is an emergent property of complex physical systems.

Accept Reply

**SUGGESTED THEMES**

Consciousness is basically when you are aware about yourself and everything around you. This also leads to better, well thought out decisions based on the observations made.

Accept Reply

**SUGGESTED THEMES**

Being aware of and responding to your surroundings.

Accept Reply

**SUGGESTED THEMES**

Consciousness is the subjective space in which experiences (qualia) arise, but is not identified with these.

Accept Reply

**SUGGESTED THEMES**

Consciousness is the brain's ability to switch between different neural pathways based on rapidly changing sensory input.

**SUGGESTED THEMES**

Ask the observer, about what it means to be, or I'm not going to even guess.

Accept Reply

**SUGGESTED THEMES**

Consciousness is just a combination of different of **neural mechanisms**.

Accept Reply

Consciousness is the combination of awareness and sentience.

**Duplicate claim**  
Without marking it, people will get confused and already are.

Although there is no unanimous scientific consensus as to what consciousness is, there is a growing consensus forming around what is known as **"Dispositional-Qualia Theory"** (DQT). This defines consciousness as computationally-bound elemental physical qualia we are directly aware of, the redness and greenness.

**of Misconception**

**of Sentience** ("one capable of sensing and responding to its world") is an example of this.

**of Consciousness** is everything one can experience.

Selective awareness of oneself in one's surroundings through the receiving of information in the context of one's signals (i.e. from senses) is **of attention**: bodily, technologically, etc.; logic, etc.) for decision-making to better oneself in them.

As per Larmer's model (one of **State**) phenomenal (activated unconsciously-picked information (i.e. qualia)) and access consciousness (i.e. "conscious experience").

Consciousness is the co-action of memory, rote, comprehension, prerogatives, individualism, and duality to form an **ego**, which consists of a self.

Consciousness is a calculated reaction-attachment (i.e. **attention**) being receptive to the external world for processing (i.e. internalizing) and understanding what's in it (i.e. recognition) to be aware of and be connected (i.e. responsive) to it.

An information-carrying force (like the fundamental forces of the molecular level or lower) that is used for information processing by structures (like the human body). Consciousness information path of **appreciation** or and from a source, which then interacts with said a "used by matter", thus influencing its direction and outcome and vice-versa in reality.

When one facts what works for them (that they don't currently have and doesn't have to be right or wrong), and invests in it for some benefits (of making them better off than before to grow, like a specific, purposeful outcome) is infrastructure riding on consciousness's attention wave.

**"Consciousness is intrinsic"** (due to Descartes "I think therefore I am").

Consciousness is an **of State**. We are merely a reaction machine.

**More than one claim**  
"because, should we take out"

**of Consciousness** is decision-making for producing activities on a daily basis using multiple interpretation steps that involve various biological factors (like **of neural mechanisms**).

An existence due to the capacity of the environment to allow it to happen built through what we value and put our conscious into, but is not actually real (just a concept). For instance, a line is a mathematical concept, but when drawn on paper from our own consciousness, it's made real by it.

**of Collective consciousness** (like a **of the mind** of **system intelligence**, **of brain**, etc.) collective connection of individual points receiving input from the environment, reacting to it, and letting others know about it if needed, so they could react in their mode too and continue the process until a decision is formed as a whole to address what's happening in the environment.

The sensation of awareness caused by a combination of chemical and electrical signals.

**More elsewhere and unclear**

The levels of this consciousness is divided up into **of stages** of being able to focus on one's surroundings, along with their associated **of structures**.
