

AI will become conscious one day.

Pros **Cons**

SUGGESTED PRO
Unless there is some physical phenomena occurring in the human brain that can not be explained by physical laws (which there does not seem to be), then that system can be modelled and executed electronically.

SUGGESTED CON
You can't have a debate if you don't accept people's opinions. I'm out.

SUGGESTED PRO
Human is basically a biological machine. We feel sad when our body requires vitamin D. As AI and robot advance and logic between a to b becomes complex enough, it may feel sad, when it really needs is a battery.

SUGGESTED CON
Consciousness itself is an illusion brought on by our own brain's attempt to respond to itself and its surrounding in a simple manner, therefore there is no issue regarding whether AI will become conscious one day because there is no such thing as consciousness. The closest to that in our brain also could have an on and off switch for apparent consciousness giving claim to the idea that "consciousness" is not something necessary for thinking.

If AI can become more intelligent (not just in certain areas, but altogether) than humans, it will be smart enough to find a way to be conscious.

SUGGESTED CON
AI will not become conscious, it's far too far-fetched for the modern world to develop such genius or dangerous type of AI. However the basics will always make progress. Still that is not referring to a conscious AI.

Since there are robots designed with human-specific characteristics like emotional intelligence that were previously thought not possible to have, consciousness may be another characteristic like that in the future.

The technology is advancing rapidly enough for this to happen.

AIs are a reflection of our own intelligence. So if we are conscious, so can AI be as well.

A lot of AI is biased. So adding in consciousness to AI, like the ones that exist in the movies, may not end up how we imagine it will be.

Right now, each AI is specific to one task. It'll be really difficult to combine all of them into one to mesh them together for them to work together.

It'll be difficult to get AI to truly replicate consciousness (even with trying to mimic the human brain).
